EDUCATION

University of Toronto

Honours Bachelor of Science — Mathematics and Statistics

September 2025 – Present

SUMMARY

Mathematics and Statistics student building production web applications, data systems, and automation with live users and measurable operational impact.

SKILLS

Languages: Python, TypeScript, JavaScript, SQL

Web & Backend: FastAPI, Node.js, React, Next.js, REST APIs

Data: PostgreSQL, SQLite, Supabase, SQLAlchemy, NumPy

Automation & Testing: Playwright, Pytest, Git, GitHub Actions, PowerShell

EXPERIENCE

Software Developer — GE Appraisal Consultant Service

May 2026 – August 2026

React, Supabase, PostgreSQL, Leaflet.js, Vercel

- Worked with appraisal staff to build and deploy a React/Supabase property research application for searching 200+ reports and comparing nearby properties by location and key attributes, including square footage.
- Reduced comparable-property and report lookup from **15–20 minutes to 1–3 minutes** with clustered map pins, address autocomplete, and detailed property records.
- Built report-ingestion workflows for report metadata, photos, PDFs, and document bundles; secured records with Supabase Auth, PostgreSQL row-level security, role-based access, and signed URLs.

PROJECTS

Runway — Social Media Post Creator

July 2026 – Present

Python, FastAPI, SQLAlchemy, SQLite, NumPy, Next.js, TypeScript

- Built a web application that uses a channel's previous images and captions to find new post ideas, generate caption options, and let the creator review and schedule accepted posts.
- Indexed 770+ historical posts into **4,800+ searchable image and text records** and cached 136K+ similarity results to retrieve relevant examples without repeating comparison work.
- Collected nearly 400 labeled creator preferences and evaluated two versioned caption-ranking models against the existing baseline; retained the baseline after offline tests showed no reliable improvement.

CS2 Marketplace Automation

January 2026 – Present

Python, Node.js, Playwright, REST APIs, GitHub Actions

- Built Python and Playwright workflows using marketplace REST APIs to process 73K+ unique listings, compare prices, and submit offers or purchases within configured limits.
- Managed 150+ buy-order targets by checking live marketplace data, repricing outbid orders within price limits, restoring missing orders, and retiring outdated ones.
- Synchronized inventory, relisted items, and tracked 500+ sold items, generating **US\$2.3K+ in net realized profit after fees**.
- Persisted pending actions, prevented duplicate offers or purchases after crashes, enforced balance and rate limits, and verified uncertain responses before retrying.

Automation Supervisor — Monitoring & Recovery

June 2026 – Present

Python, Textual, Windows ConPTY, PowerShell

- Built a Python/Textual process supervisor that extended two live automation systems from an 8-hour daily operating window to **24/7 supervised coverage**.
- Recovered jobs after crashes, network outages, terminal exits, and restarts using completion validation, controlled retries, and an independent watchdog.
- Validated crash, hang, restart, and network-loss recovery with automated tests covering 60+ fault scenarios.

ADDITIONAL EXPERIENCE

Content Creator — YouTube / Social Media

2021 – Present

- Grew channels to **140M+ views, 290K+ followers, and US\$16K+ in revenue**; used retention analytics to guide repeatable content experiments.
